A 3-month-old girl presented to the surgical consultation room with bilateral cleft lip incomplete. A girl weighing 4205 g. was born at term after an uneventful pregnancy with a birth weight of 2500 g. There was no family history. On examination, a congenital, linear, erythematous cutaneous anomaly on the left side of her neck was highlighted with ocular anomalies (strabismus and the eyes are widely spaced) and a broad nose with a flattened tip. The examination of the other systems was unremarkable. In front of the association of these different anomalies BOFS was suspected but molecular diagnosis has not been made. The child benefited surgery to correct cleft lip with tennisson procedure with a good postoperative result.
